

1. A streaming video customer launches a corporate-wide videoconference over a T1 connection to announce its latest earnings report.

4. The videoconference is broadcast to the corporate customer site, as well as to event participants on the Internet.

2. The Servertron switch directs the video broadcast request to a server on Intrira's network -- it chooses the server based on performance requirements for the session and availability of the system.

3. The Real Networks' RealVideo and Microsoft Windows Media Technologies servers run the broadcast. They later archive the videoconference for playback-on-demand.
